

iWork on your Mavericks machine is different than iWork on the other machines. iWork in Mavericks (Pages, Keynote, Numbers) autosaves. There is no longer a “Save As...” option. If you want to open an existing document and edit a copy with a different name, use File... Duplicate. It'll create a duplicate copy for you to work on. When you quit, it'll prompt you to save.

If you have iWork 09 and iWork Mavericks on a computer, it'll open all files (even those created and saved as iWork 09 files) with the Mavericks version.

If you create a Pages document on an iPad, it will only open in the Mavericks version of iWork. If students are exporting their iPad Pages or Keynote files to their cloud to work on later from a computer, they should select Word when they send the file to WebDAV.

1. When you are in a newer version of iWorks, you may need to save down to iWorks 09 version so that you can work on the file on an older version of iWorks. While in the new version of your iWork project, go to the File menu and select Export To... Pages '09.

2. Click Next...

3. Just to keep your files straight, I suggest you add 09 in the file name. Click Export.

4. If you have changed the name of your file when exporting, you'll see both copies of the file. iWorks on Mavericks will open old and new files. iWorks on older computers will only open iWork 09 files.
